## **New ScanMaster Controller Release Introduces Enhanced Application-Based Features**

*Ideal for Additive Manufacturing, 3D Marking, Micromachining and Cell Therapy Manufacturing*

**Bedford, Mass.** (March 25, 2021) – Cambridge Technology, a business unit of Novanta Corporation (“Novanta”), announces the new release of version 3.1 of ScanMaster Controller (SMC) and ScanMaster Designer (SMD) featuring application-specific features and optimized laser scanning control.

This release features:

- Scan time estimation feature for laser scanning processes enable smart build time estimation and maximize the machine utilization rate.
- 3D wrapping and tracing for marking on curve surfaces eliminate complex process setup and deliver high quality 3D marking.
- Skywriting aids at executing shapes and text at consistent marking speed, delivering uniform distribution of laser energy to achieve quality processing results.
- Single controller to support galvanometer and polygon scan heads enabling single technology solution

These application-based features will enhance laser scanning control using ScanMaster and help deliver more precise and enhanced results. For more information about ScanMaster Controller and ScanMaster Designer, visit [www.cambridgetechnology.com](http://www.cambridgetechnology.com).

### **About Cambridge Technology**

Cambridge Technology, a business unit of Novanta, offers a broad range of analog, digital, and hybrid laser beam steering solutions, partnering with customers to enable maximum performance in fully integrated systems. For more information, visit [www.cambridgetechnology.com](http://www.cambridgetechnology.com).

### **About Novanta**

Novanta is a trusted technology partner to original equipment manufacturers in the medical and advanced industrial technology markets, with deep proprietary expertise in photonics, vision and precision motion technologies. For more information, visit [www.novanta.com](http://www.novanta.com).
